### DETAILED ACTION

1. This action replaces action sent by examiner on 8/18/05 to correct the examiner's error in rejecting under the improper 35 USC 102 paragraph. The examiner apologizes for any inconvenience to the applicant.

### ***Claim Rejections - 35 USC § 102***

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(d) the invention was first patented or caused to be patented, or was the subject of an inventor's certificate, by the applicant or his legal representatives or assigns in a foreign country prior to the date of the application for patent in this country on an application for patent or inventor's certificate filed more than twelve months before the filing of the application in the United States.

(a) the invention was known or used by others in this country, or patented or described in a printed publication in this or a foreign country, before the invention thereof by the applicant for a patent.

3. Claims 1-5 are rejected under 35 U.S.C. 102(a) as being anticipated by Tsuta (JP2001025464A).

Tsuta discloses a method for analyzing facial deformation process using a finite element method, which is active by virtue of the time series utilized to represent the change in face muscles over a period of time. Tsuta's patent was issued on January 30, 2001, with an application date of May 9, 2000.

***Relevant Prior Art***

4. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Husseiny (5210704) discloses a system for determining wearout and predicting life expectancy of a mechanical structure using a finite element technique, whereby a dynamic analysis using a drift and diffusion analysis determines the prediction model of life expectancy.

Backer (5377119) discloses a method of optimizing casting conditions using a finite element computer model, where a series of calculations determines the volume of gas remaining in the mold cavity at any time by using the volumetric flow rate.

Chatham (5531122) discloses a fatigue analysis system and method used for construction and mining equipment which incorporates compliant finite element representations of a truck frame, dump body, and rear axle housing into a dynamic mechanical simulation mode.

Schaff (6708141) discloses a finite element method and apparatus for modeling cellular structure and simulation results are directly correlated with experimental time series data sets.
